Identification and clinical assessment of suspected vaccine-related field strains of porcine reproductive and respiratory syndrome virus.

Mengeling WL, Vorwald AC, Lager KM, Clouser DE, Wesley RD.

Virology Swine Research Unit, National Animal Disease Center, USDA, Agricultural Research Service, Ames, IA 50010, USA.

OBJECTIVE: To determine the origin and clinical relevance of selected strains of porcine reproductive and respiratory syndrome (PRRS) virus (PRRSV). **ANIMALS:** 38 pigs without antibodies for PRRSV. **PROCEDURE:** A seemingly uncommon restriction endonuclease digestion site in a commercially available vaccine strain of attenuated PRRSV was tested for its stability and prevalence under defined conditions. Selected field strains of PRRSV, with or without the restriction-site marker, were subsequently tested in pigs for virulence and for their ability to replicate competitively in pigs simultaneously given the vaccine. **RESULTS:** Under experimental conditions, the restriction-site marker was stable during long-term infection of pigs. It was not detected in any of the 25 field strains of PRRSV that were isolated before use of the vaccine or 21 of 25 field strains that were isolated after use of the vaccine but that, on the basis of previous testing, were believed unrelated to the vaccine strain. Conversely, it was detected in 24 of 25 field strains that were isolated after use of the vaccine and that, on the basis of previous testing, were believed to be direct-line descendants of the vaccine strain. Putative vaccine-related strains caused more pronounced pathologic changes than did the vaccine strain alone, and they predominated during replication in pigs also given the vaccine strain. **CONCLUSIONS:** In some swine herds, the vaccine strain may have persisted and mutated to a less attenuated form. **CLINICAL RELEVANCE:** The potential for persistence and mutation of specific strains of virus should be an important consideration when designing vaccination programs involving attenuated PRRSV.

L6 ANSWER 1 OF 3 MEDLINE on STN
AB The genetic variability of porcine reproductive and respiratory syndrome virus (PRRSV) was studied by restriction fragment length polymorphism (RFLP) of polymerase chain reaction (PCR)-amplified fragments among 50 Korean isolates from open reading frame 5. All Korean PRRSVs were isolated from the field cases after the marketing of an U.S. ATCC VR2332-derived modified live PRRSV vaccine. Combining the **restriction enzyme** digestion patterns obtained with MluI, HincII, SacII, and HaeIII, we observed 19 distinct RFLP patterns. Seventeen out of 50 PRRSV isolates (34%) exhibited the modified live PRRSV vaccine RFLP pattern. The genomic variations that have been identified in the present study seemed to represent characteristic features of the Korean PRRSV isolates. PCR-based RFLP analysis using several restriction enzymes provides a good genetic estimate for isolate differentiation.

L6 ANSWER 2 OF 3 MEDLINE on STN
AB Neonatal pigs from three herds of pigs were somnolent and inappetent and had microscopic lesions characterised by severe meningoencephalitis, necrotic interstitial pneumonia and gastric muscular inflammation. Porcine reproductive and respiratory syndrome virus (PRRSV) infection was diagnosed and confirmed by virus isolation, fluorescent antibody examination of frozen lung sections, serology, immunohistochemistry and in situ hybridisation. Each herd had a history of PRRSV infection and was using or had used a modified-live vaccine. The isolates from the affected pigs were genetically distinct from the modified-live vaccine strain of the virus when compared by **restriction enzyme** analysis and nucleotide sequencing of PRRSV open reading frames 5 and 6. The virus was identified in macrophages or microglia of brain lesions by immunohistochemical staining of brain sections with an anti-PRRSV monoclonal antibody and an anti-macrophage antibody. The replication of the virus in the brain was verified by in situ hybridisation. The meningoencephalitis induced by the virus in pigs from each of the herds was unusually severe and the brain lesions were atypical when compared with other descriptions of encephalitis induced by the virus, which should therefore be considered as a possible diagnosis for neonatal pigs with severe meningoencephalitis. In addition, field isolates of the virus which are capable of causing disease can emerge and coexist with modified-live vaccine virus in some pig herds.

L6 ANSWER 3 OF 3 MEDLINE on STN
AB The suitability of restriction fragment length polymorphism (RFLP) analysis for differentiating a porcine reproductive and respiratory syndrome virus (PRRSV) vaccine strain from other North American field strains was investigated. Open reading frame 5 nucleotide sequence data of the vaccine virus, its parent strain VR-2332, and 22 other strains of PRRSV included in this study indicated that 3 **restriction enzyme** gel patterns characterize the vaccine virus and the parent strain genotype. The combined 3 RFLP patterns differentiate the vaccine and parent virus from other PRRSV strains. This test will be a valuable tool in epidemiologic studies and will be useful in identifying individual strains in cases of multistrain PRRSV infections.

AB Non-radioactive probes that can detect specifically North American and
European isolates of porcine reproductive and respiratory syndrome virus (**PRRSV**) in formalin-fixed paraffin-embedded tissues by in situ
hybridization were developed. These probes allow the
differentiation between North American and European genotypes of
the PRRS virus as well as the detection of both genotypes. Two amplified
cDNA products generated by polymerase chain reaction (PCR), one from the
cDNA of the Canadian PRRSV LHVA-93-3 isolate and the second one
from the European Lelystad isolate, and labelled with digoxigenin were
utilized as probes. The LHVA-93-3 derived probe was found to detect
Canadian and USA PRRSV isolates in infected cells, while the
Lelystad derived probe hybridized only with European isolates. The
specificity of both probes was also demonstrated on formalin-fixed tissues
collected from PRRSV infected pigs. Furthermore, by combining
the LHVA-93-3 (North American) probe and the Lelystad (European) probe,
successful detection of both PRRSV genotypes in fixed tissues
could be achieved.

[Related Articles](#), [Links](#)

Comparison of molecular and biological characteristics of a modified live porcine reproductive and respiratory syndrome virus (PRRSV) vaccine (ingelvac PRRS MLV), the parent strain of the vaccine (ATCC VR2332), ATCC VR2385, and two recent field isolates of PRRSV.

J Virol. 2002 Dec;76(23):11837-44.

PMID: 12414926 [PubMed - indexed for MEDLINE]

☐ 11: [Mengeling WL, Lager KM, Vorwald AC, Clouser DF.](#)

[Related Articles](#), [Links](#)

Comparative safety and efficacy of attenuated single-strain and multi-strain vaccines for porcine reproductive and respiratory syndrome.

Vet Microbiol. 2003 May 2;93(1):25-38.

PMID: 12591204 [PubMed - indexed for MEDLINE]

☐ 12: [Mengeling WL, Lager KM, Wesley RD, Clouser DF, Vorwald AC, Roof MB.](#)

[Related Articles](#), [Links](#)

Diagnostic implications of concurrent inoculation with attenuated and virulent strains of porcine reproductive and respiratory syndrome virus.

Am J Vet Res. 1999 Jan;60(1):119-22.

PMID: 9918159 [PubMed - indexed for MEDLINE]

☐ 13: [Mengeling WL, Vorwald AC, Lager KM, Clouser DF, Wesley RD.](#)

[Related Articles](#), [Links](#)

Identification and clinical assessment of suspected vaccine-related field strains of porcine reproductive and respiratory syndrome virus.

Am J Vet Res. 1999 Mar;60(3):334-40.

PMID: 10188816 [PubMed - indexed for MEDLINE]

☐ 14: [Cha SH, Chang CC, Yoon KJ.](#)

[Related Articles](#), [Links](#)

Instability of the restriction fragment length polymorphism pattern of open reading frame 5 of porcine reproductive and respiratory syndrome

virus during sequential pig-to-pig passages.
J Clin Microbiol. 2004 Oct;42(10):4462-7.
PMID: 15472294 [PubMed - indexed for MEDLINE]

- ☐ 15: [Nielsen HS, Storgaard T, Oleksiewicz MB.](#) [Related Articles](#), [Links](#)

 Analysis of ORF 1 in European porcine reproductive and respiratory syndrome virus by long RT-PCR and restriction fragment length polymorphism (RFLP) analysis.
Vet Microbiol. 2000 Oct 1;76(3):221-8.
PMID: 10973697 [PubMed - indexed for MEDLINE]

- ☐ 16: [Mengeling WL, Lager KM, Vorwald AC, Koehler KJ.](#) [Related Articles](#), [Links](#)

 Strain specificity of the immune response of pigs following vaccination with various strains of porcine reproductive and respiratory syndrome virus.
Vet Microbiol. 2003 May 2;93(1):13-24.
PMID: 12591203 [PubMed - indexed for MEDLINE]

- ☐ 17: [Shen S, Kwang J, Liu W, Liu DX.](#) [Related Articles](#), [Links](#)

 Determination of the complete nucleotide sequence of a vaccine strain of porcine reproductive and respiratory syndrome virus and identification of the Nsp2 gene with a unique insertion.
Arch Virol. 2000;145(5):871-83.
PMID: 10881675 [PubMed - indexed for MEDLINE]

- ☐ 18: [Magar R, Larochelle R.](#) [Related Articles](#), [Links](#)

 Evaluation of the presence of porcine reproductive and respiratory syndrome virus in pig meat and experimental transmission following oral exposure.
Can J Vet Res. 2004 Oct;68(4):259-66.
PMID: 15581220 [PubMed - indexed for MEDLINE]

- ☐ 19: [Oleksiewicz MB, Botner A, Madsen KG, Storgaard T.](#) [Related Articles](#), [Links](#)

 Sensitive detection and typing of porcine reproductive and respiratory syndrome virus by RT-PCR amplification of whole viral genes.
Vet Microbiol. 1998 Nov;64(1):7-22.
PMID: 9874099 [PubMed - indexed for MEDLINE]

- ☐ 20: [Suarez P, Zardoya R, Martin MJ, Prieto C, Dopazo J, Solana A, Castro JM.](#) [Related Articles](#), [Links](#)

 Phylogenetic relationships of european strains of porcine reproductive and respiratory syndrome virus (PRRSV) inferred from DNA sequences of putative ORF-5 and ORF-7 genes.
Virus Res. 1996 Jun;42(1-2):159-65.
PMID: 8806183 [PubMed - indexed for MEDLINE]

- L11 ANSWER 1 OF 13 MEDLINE on STN
TI Simultaneous detection of North American and European porcine reproductive and respiratory syndrome virus using real-time quantitative reverse transcriptase-PCR.
- L11 ANSWER 2 OF 13 MEDLINE on STN
TI Decreased protein accretion in pigs with viral and bacterial pneumonia is associated with increased myostatin expression in muscle.
- L11 ANSWER 3 OF 13 MEDLINE on STN
TI Detection and **differentiation** of North American and European genotypes of porcine reproductive and respiratory syndrome virus in formalin-fixed, paraffin-embedded tissues by multiplex reverse transcription-nested polymerase chain reaction.
- L11 ANSWER 4 OF 13 MEDLINE on STN
TI Nucleocapsid protein-based enzyme-linked immunosorbent assay for detection and **differentiation** of antibodies against European and North American porcine reproductive and respiratory syndrome virus.
- L11 ANSWER 5 OF 13 MEDLINE on STN
TI Quantitative TaqMan RT-PCR for the detection and **differentiation** of European and North American strains of porcine reproductive and respiratory syndrome virus.
- L11 ANSWER 6 OF 13 MEDLINE on STN
TI In utero infection by porcine reproductive and respiratory syndrome virus is sufficient to increase susceptibility of piglets to challenge by Streptococcus suis type II.
- L11 ANSWER 7 OF 13 MEDLINE on STN
TI Antigenic variation and genotype of isolates of porcine reproductive and respiratory syndrome virus in Korea.
- L11 ANSWER 8 OF 13 MEDLINE on STN
TI Restriction fragment length polymorphism analysis of open reading frame 5 gene of porcine reproductive and respiratory syndrome virus isolates in Korea.
- L11 ANSWER 9 OF 13 MEDLINE on STN
TI Effects of origin and state of **differentiation** and activation of monocytes/macrophages on their susceptibility to porcine reproductive and respiratory syndrome virus (PRRSV).
- L11 ANSWER 10 OF 13 MEDLINE on STN
TI **Differentiation** of a porcine reproductive and respiratory syndrome virus vaccine strain from North American field strains by restriction fragment length polymorphism analysis of ORF 5.
- L11 ANSWER 11 OF 13 MEDLINE on STN
TI **Differentiation** between porcine reproductive and respiratory syndrome virus isolates by restriction fragment length polymorphism of their ORFs 6 and 7 genes.
- L11 ANSWER 12 OF 13 MEDLINE on STN
TI **Differentiation** of North American and European porcine reproductive and respiratory syndrome virus genotypes by in situ hybridization.
- L11 ANSWER 13 OF 13 MEDLINE on STN
TI Detection of porcine reproductive and respiratory syndrome virus and efficient **differentiation** between Canadian and European strains by reverse transcription and PCR amplification.
